Assignment 1 HTML & CSS

Individual Assignment (No groups required)

Campus Events Guide Website

Create a responsive Campus Events Guide website that helps students discover events, read the details of one event, check the timetable, and register. Use the same sample event consistently across the five pages, so they form one connected website. Use only HTML and CSS.

Website pages

File	Required content
index.html	Home page for Campus Events Guide. Introduce the site and show at least three featured campus events. Each event has a title, date, venue, and link to its detail page.
events.html	Event catalogue. Show upcoming and past events as cards with posters, dates, venues, and categories. Include the event featured on the home page.
event-details.html	Detail page for one featured event. Show its poster, description, date, time, venue, agenda, ticket or entry information, media, and a registration link. Add an event review form with a file upload.
schedule.html	Campus event timetable. Use an HTML table with column headings for event, date, time, and venue. The featured event must appear here with matching details.
registration.html	Registration page for the featured event. Show its name and date above a validated form with the required HTML5 controls, plus event contact details.

Technical requirements

- Use semantic HTML5 elements such as header, nav, main, section, article, and footer. Show the site name Campus Events Guide on every page. Navigation must connect all five pages, and the footer must contain consistent social links.
- Include at least one list, one table with headings, relevant event imagery, one audio or video element, and forms with labels and HTML5 validation attributes such as required, pattern, and maxlength.
- The registration form must demonstrate text, email, url, number, range, date, color, time, file, checkbox, radio, select, and textarea controls. Choose event-related labels, such as attendee name, arrival time, event choice, and access needs.
- Put all styles in one external style.css file. Use CSS variables for the color palette, at least one complex selector, both Flexbox and Grid, hover transitions, responsive media queries, and a CSS-only dark mode toggle.
- Forms demonstrate interface design and browser validation. They do not need to save or send submissions. Do not add JavaScript, inline CSS, frameworks, libraries, or ready-made templates.

Submission package

Submit one folder named campus_events_yourname containing the five HTML files, style.css, and an assets folder. Use relative paths for local files. Test the pages in Chrome or Edge at mobile, tablet, and desktop widths. The final

HTML and CSS must be your own work. Include a link to your GitHub repo you used while implementing this assignment.

Detailed grading rubric

Total 100 points: 70 points for the website requirements and 30 points for understanding.

Criterion	Pts	Evidence required for full credit
HTML: five pages and navigation	5	All five named HTML files open. Every page links to all five pages. The featured event connects home, events, details, schedule, and registration with working links and matching title and date.
HTML: semantic structure	2	Each page has one h1, headings follow a logical order, and header, nav, main, section or article, and footer are used for their intended content.
HTML: shared elements	2	All five pages show the same navigation pattern and footer with working social links.
HTML: event content	2	The site includes a meaningful event list, a schedule table with headings, event posters or photos with alt text, and playable audio or video on event-details.html.
HTML: forms and validation	2	Event review and registration forms have associated labels; the review form has a file input; registration includes every specified HTML5 control and relevant validation.
CSS: external file and variables	3	All five pages load style.css with no inline or internal CSS. At least three color variables are reused for backgrounds, text, and accents.
CSS: layout methods	4	Flexbox lays out navigation or controls, and Grid lays out event cards or another multi-column area. Both layouts remain usable at narrow widths.
CSS: selector and transitions	3	At least one selector combines three parts or a pseudo-class; two or more interactive elements have visible hover or focus transitions.
CSS: dark mode	3	A CSS-only control switches background, text, card, and form colors while keeping text readable.
CSS: component styling	5	Buttons, event cards, table, forms, headings, and spacing have defined, consistent styling.
Responsive: mobile	5	At 375 px width, all five pages remain usable: navigation is accessible, event cards reflow, forms fit, and text is readable without zooming.
Responsive: tablet and desktop	4	At about 768 px and 1280 px, media queries adapt columns and spacing; content is neither crowded nor stretched.
Responsive: content	5	Images fit their containers, the timetable remains readable or scrolls within its wrapper, and inputs stay within the viewport.
Responsive: overflow	2	No page has unintended horizontal scrolling, clipped text, or overlapping elements at 375 px, 768 px, or 1280 px.
Design: complete event journey	5	A visitor can follow the same featured event from home to catalogue, details,

Criterion	Pts	Evidence required for full credit
		timetable, and registration. Its title and date agree across the pages.
Design: imagery	3	At least three relevant event images or illustrations load, fit their containers, and have useful alt text.
Design: consistency	4	Header, footer, page width, colors, buttons, and event cards follow the same visual rules on all five pages.
Design: information hierarchy	4	Page titles, section headings, event dates and venues, registration actions, and form labels are distinguishable at a glance.
Code: organization and comments	4	HTML and CSS use consistent indentation and descriptive names (2). Brief comments explain two non-obvious sections, such as dark mode or responsive navigation (2).
Submission and restrictions	3	The folder contains the five HTML files, style.css, and assets (2); local links are relative (1); the site uses no JavaScript, inline CSS, frameworks, libraries, or templates (1).
Understanding	30	Understanding of the technical details and technologies used in implementing the deliverables.

Grading Policy

- Following the rubric and understanding deliverables and their details will be evaluated.
- Your project GitHub is part of the evaluation weight and work proof.
- All the mentioned requirements in each deliverable are part of the evaluation criteria weights.

Deliverable Discussion/Response Policy:

● If a student is asked a question during evaluation and does not answer, 5 points will be deducted.

● If the student fails to answer a second question, an additional 5 points will be deducted.

● If the student fails to answer a third question, the student will receive 0 for the Individual Understanding mark.

● If the student fails to answer a fourth question, the student will receive 0 for the deliverable itself, regardless of any other progress or submission.
